[2] The figure shown for each item is its percent of total railroad freight.

[3] Data for December 1981 and March 1982 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

[4] The price index for total railroad freight also includes STCC groups not shown separately.

[5] Dec. 1978 = 100.

[6] This index contains shipments from a number of STCC groups.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

Revised Collection and Calculation Procedures for Railroad Freight Price Indexes

Beginning in April 1982, the following changes have been introduced in the way railroad freight price indexes are collected and calculated. These changes have been made possible by deregulation of rates for certain types of shipments and improved accuracy of price reporting.

1. Most prices used to calculate indexes are now obtained from railroad industry reporters rather than from published freight rate tariffs.
2. Indexes are now published for an additional industry subgroup: Trailer- or container-on-flat-car (TOFC/COFC) shipments.
3. Indexes are now subject to revision 4 months after original publication.
4. The methodology for calculating the indexes has been modified.
5. Indexes published from January 1979 to the present have been revised to reflect the new methodology and to correct previous errors.

A brief description of each of these changes follows.

Prices of shipments reported by railroad companies. Until April 1982, the source of data for railroad freight price indexes differed from most industry price indexes published by BLS, which generally are reported to BLS each month by the companies involved in the transactions. Prices used to compute the railroad freight indexes were obtained each month from published tariffs by rate specialists on the BLS staff.

The use of tariffs to obtain prices had several shortcomings. Railroad rate tariffs are numerous and intricate. Finding the correct tariff and item to establish a base rate for shipments in the BLS sample, which encompasses a vast array of shipments by commodity and geographic locations, was difficult. In addition, complex general rate increases had to be applied periodically to the base rate to obtain the correct shipment price. The new procedures will make use of the expertise of freight rate specialists in the railroad industry who are familiar with particular types of shipments and who provide price quotes and billings to shippers.

In addition to obtaining the correct prices, maintaining a constant sample of shipments to price is difficult. In the real world, shipment characteristics change over time, and these changes should be accounted for in calculating price changes. The rates published in tariffs each month often do not provide information on shipment changes. For example, coal mines were closed and rail shipments from these mines were ended months or years before the tariffs were discontinued. Direct price reporting enables railroads to indicate which shipments can still be made and also report any changes in specification of the shipments.

In addition, some railroad shipments have recently been exempted from rate regulation, and tariffs for these may no longer be published. For such shipments, prices can only be obtained from the railroads.

An experiment involving collection of prices directly from the railroad companies for 90 of the 550 shipments in the railroad freight sample was begun in the fall of 1980. The results demonstrated that more accurate prices could be collected from the railroads without too great a burden on them. Ninety percent of the railroad companies involved in transporting shipments in the BLS sample have reported prices each month. For the remaining 10 percent, BLS staff members will continue to use published tariffs. These tariffs will also be used to analyze and verify rates reported directly by the railroads.

Indexes for TOFC/COFC shipments. In March 1981, the Interstate Commerce Commission exempted shipments made in trailers or containers on railroad flat cars (TOFC/COFC) from rate regulation. A number of users have expressed an interest in a price index for these shipments. The sample of shipments is sufficiently large to estimate and publish a statistically valid index for this subgroup.

Table 14 contains monthly indexes for this category from January 1979 through April 1982. An index for TOFC/COFC shipments will be published each month in table 11.

Indexes revised 4 months after initial publication. The need to correct prices previously collected was a persistent problem. Although the new procedure of using prices obtained from the railroads should reduce this problem, it will not eliminate all pricing errors. Also, indexes are initially published within 3 to 4 weeks of the pricing date. With direct reporting from the railroads, some prices may not be received until after publication deadlines. In the past, prices could be computed from published tariffs.

Therefore, beginning with the release of the May 1982 data, all indexes will be subject to revision 4 months after they are first published to incorporate late reports and to correct reporting errors. A similar 4-month revision policy is presently used for Producer Price Indexes.

Modifications in calculation methodology. Two changes have been made in the methodology used to calculate railroad freight price indexes. (The previous methodology is described in the technical note published in *Producer Prices and Price Indexes, Data for June 1979.*)

The first change is in the method used to bring seasonal items back into the indexes during their shipping season. Previously, when an inactive shipment was brought back into the index, a monthly price relative was calculated for that item which included all price changes in the shipment since its last active month. This method tends to double count price changes for seasonal items because the active shipments in the commodity grouping have, in effect, moved the inactive shipment's weight during its inactive period. The new method moves the inactive shipment's last price forward by the change in the index for the commodity group in which the inactive shipment is classified before the monthly price relative is calculated. The monthly price relative used for the shipment will then reflect only the difference in price trend for the shipment from that of the rest of the category.

The other change involves the method of calculating weights used to aggregate indexes. Indexes are calculated from prices for all items that are active in any given month. Shipments are linked out of the indexes if they no longer occur, either permanently or seasonally, or if valid prices cannot be collected. Indexes are calculated with the remaining active items. Items that become inactive are used to calculate indexes until the month in which they are linked out. These price relatives also affect the relative importance of shipments in the index. The old method had a minor flaw in calculating the relative importance of item when a shipment became inactive. This fairly minor problem has been corrected.

When railroad freight price indexes were recalculated from corrected prices by both the new and old weighting formulas, virtually all of the difference between the revised and the original indexes resulted from price corrections. The actual impact of methodology changes is quite small.

Revised indexes for January 1979 to March 1982. Since January 1979, railroad freight price indexes have been calculated from a sample of shipments made during 1976. All indexes published since this new sample of shipments was introduced have been recalculated and republished this month in table 14. Although a number of pricing errors were discovered after indexes were first published, the old computer programs did not correct errors in the month they were made. Instead, corrections were reflected in the month they were discovered. These corrections are now reflected in the proper month. Also, prices that the railroad companies have begun to report have led to the correction of other pricing errors.

Additional information on this revision of the railroad freight price indexes may be obtained by request from the Bureau of Labor Statistics, Office of Prices and Living Conditions, Division of Industrial Prices and Price Indexes, Room 5210, 600 E Street N.W., Washington, D.C. 20212.

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

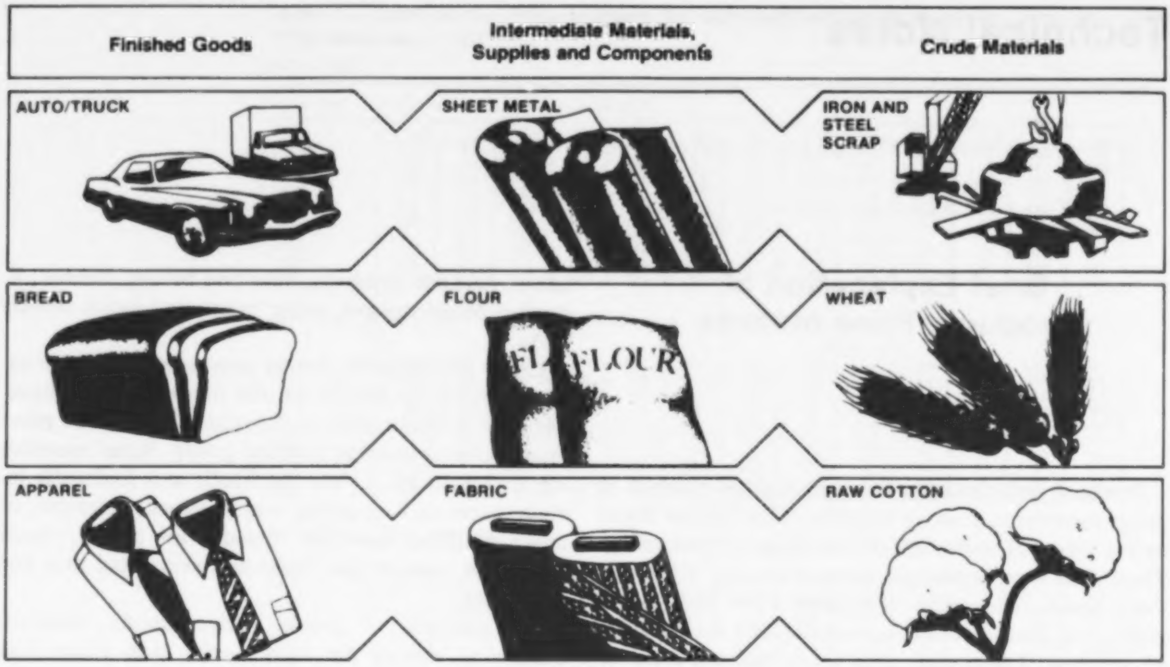
Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price change by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices



generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from $100 in 1967 to $225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change	
Finished Goods Price Index	185.5
less previous index	184.5
equals index point change	1.0
Index Percent Change	
Index point change	1.0
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude

every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 11,12, and 13. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables 6, 11, or 13 on their original base period of 1967 = 100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11,12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be

constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights*. Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling*. In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979. Price Movements
May 1982

The Producer Price Index for Finished Goods showed no change on a seasonally adjusted basis from April to May. This marked the third consecutive month of little or no change in the index. Prices for intermediate goods edged up 0.1 percent, after falling 0.6 percent in April. Crude material prices climbed 2.2 percent, the second consecutive substantial monthly advance (table A).

Among finished goods, price indexes for consumer foods and for consumer goods other than foods and energy rose only about half as fast as in April. The energy goods index dropped sharply, although not so much as in the previous month. Capital equipment prices moved up 0.4 percent for the second consecutive month.

Before seasonal adjustment, the Producer Price Index for Finished Goods rose 0.3 percent to 277.7 (1967 = 100). Over the year, the Finished Goods Price Index increased 3.0 percent. In contrast, the index had climbed 10.8 percent in the 12 months ended in May 1981. From May 1981 to May 1982, the index for finished consumer foods rose 3.8 percent, prices for finished energy goods declined 11.2 percent, the index for finished consumer goods other than foods and energy advanced 5.4 percent, and capital equipment prices moved up 6.0 percent. The Producer Price Index for intermediate goods was 1.0 percent higher than a year earlier, while crude material prices were down 1.9 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods edged down 0.1 percent in May on a seasonally adjusted basis, after no change in April. Declines for energy goods more than offset increases for foods.

The finished energy goods index fell 3.1 percent, the fifth consecutive monthly decrease. In the first 5 months of this year, this index declined at an annual rate of 27.5 percent. The gasoline index fell almost as sharply as in April; the home heating oil index also dropped but far less than in either of the 2 previous months. (Because prices for refined petroleum products are routinely lagged one month, the May indexes for gasoline and home heating oil reflected April prices.) Natural gas rose 1.8 percent, the fourth consecutive increase of about 2 percent.

The index for finished consumer foods rose 0.7 per-

cent, following a 1.6 percent advance in April. Price increases slowed markedly for pork (4.4 vs. 13.5 percent) and beef and veal (0.9 vs. 3.7 percent). Price increases also slowed for fish. Prices for eggs and fresh fruits turned down after rising in April. Roasted coffee prices fell more than in the preceding month, and prices for whole black pepper fell sharply after no change in April. On the other hand, prices climbed rapidly after declining in April for fresh and dried vegetables and milled rice; prices rose faster than a month earlier for processed poultry, shortening and cooking oils, and flour base mixes. Refined sugar rose 3.9 percent, following no change in April.

The rise in the index for finished consumer goods other than foods and energy slowed to 0.3 percent, after increasing 0.6 percent in April. Much of the deceleration was due to a downturn in prices for gold jewelry, tobacco products, leather footwear, luggage and small leather goods, and household flatware. Price increases slowed somewhat for several other goods, including household furniture and pharmaceutical preparations. On the other hand, prices turned up after declining in April for passenger cars, apparel, silver jewelry, and costume jewelry. Prices for light motor trucks rose 4.0 percent after edging up 0.1 percent in April. Price increases also accelerated for cosmetics and household appliances. Prices for periodicals and electric lamps continued to rise rapidly.

Capital equipment. The Producer Price Index for capital equipment increased 0.4 percent, about the same as in each of the previous 2 months. The May advance was chiefly due to increases for motor vehicles, integrating and measuring instruments, rubber working machinery, industrial process furnaces and ovens, mining machinery, and woodworking machinery. In contrast, photographic equipment prices declined.

Intermediate materials

The Producer Price Index for Intermediate Materials, Supplies, and Components edged up 0.1 percent in May on a seasonally adjusted basis, following 3 consecutive declines. The 1.0 percent increase in this index from May 1981 to May 1982 was the smallest 12-month change since December 1967.

The index for intermediate materials excluding foods and energy rose 0.4 percent, after showing very little change over the past several months. The May increase was led by a 0.9 percent advance in the durable manufacturing materials index, which in turn largely resulted from a seasonally adjusted rise in the steel mill products index. (Steel prices remained unchanged in May before seasonal adjustment.) Prices for copper mill shapes moved up, while decreases were registered for silver, gold, titanium, and lead.

The index for nondurable manufacturing materials edged down 0.1 percent, much less than the 1.5 percent drop in April. Prices for finished fabrics, industrial chemicals, and plastic resins showed smaller declines compared to the prior month. In addition, prices for woodpulp, synthetic fibers, gray fabrics, phosphates, and inedible fats and oils turned up after falling in April.

The construction materials index moved up 0.2 percent; this index was at virtually the same level in May as it was 6 months earlier. Higher prices were recorded for plywood, asphalt roofing, and building paper and board. In contrast, prices for asphalt paving mixtures, plastic construction products, and clay sewer pipes declined.

In the manufacturing components category, price advances occurred for nonautomotive metal stampings, motor vehicle parts, and internal combustion engines. In other categories, prices increased for foamed rubber, metal containers, photographic supplies, and unsupported plastic film and sheeting, but fell for glass containers and pesticides.

The index for intermediate energy goods declined 2.2 percent, about the same as in April. Continued substantial decreases were registered for gasoline, diesel fuel, commercial jet fuel, liquefied petroleum gas, and kerosene. Electric power prices turned down, while residual fuel prices rose.

The intermediate foods and feeds index move up 1.7 percent, somewhat less than in the previous month. Higher prices for refined sugar used in food manufacturing, animal feeds, crude vegetable oils, and animal fats and oils were partly offset by lower flour prices.

Crude materials

The Producer Price Index for Crude Materials for Further Processing rose 2.2 percent on a seasonally adjusted basis, slightly more than the 1.8 percent increase in April. The index for crude foodstuffs and feedstuffs moved up 2.7 percent, after rising 3.5 percent in the preceding month. Advances for cattle, hogs, oilseeds, and hay were substantial, although not as large as in the previous month. On the other hand, the increase for sugar accelerated to 10.9 percent. Corn prices also moved up more than in April. Prices for live poultry and wheat, which had fallen in the previous month, turned up in May.

The index for crude nonfood materials other than energy advanced 3.9 percent, after rising 1.9 percent in April and falling in each of the 8 months before that. Prices for copper base scrap, which had decreased for 8 consecutive months, turned up dramatically.Prices for sand and gravel rose considerably more than in other recent months. Raw cotton climbed more than 3 percent for the third consecutive month, and iron ore prices jumped more than in any month since February 1981. Prices for crude natural rubber and potash continued to rise. On the other hand, prices for iron and steel scrap and wastepaper continued to fall sharply, and prices for logs and timber declined after rising in each of the 3 previous months. Aluminum base scrap and cattle hide prices also dropped, but much less than in April.

The crude energy materials index moved up 0.7 percent following 3 months of decreases. Prices for natural gas continued to climb at about the same pace as in other recent months. Crude petroleum prices were unchanged after decreasing for 3 months.

[1] Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 89 percent of total finished goods, about 88 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

[2] All data are subject to revision 4 months after original publication.

[3] Not seasonally adjusted.

[4] Not available.

NOTE: Relative importance figures have been revised to reflect revisions in December 1981.

[1] Standard Transportation Commodity Code.

[2] The price index for total railroad freight also includes STCC groups not shown separately.

[3] The figure shown for each item is its percent of total railroad freight.

[4] Dec. 1978 = 100.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

NOTE: U.S. Postal Service price indexes are introduced here for the first time for January 1972 through December 1976. Quantity weights from calendar 1972 were used in calculating these additional historical indexes. The index base remains 1977 = 100 for USPS indexes, 1972 through present.

Minor corrections have been included for four of the above historical series for 1977 through present. These are international air mail, 4311-511; international surface mail, 4311-512; international mail, 4311-5; and United States Postal Service, 4311.

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

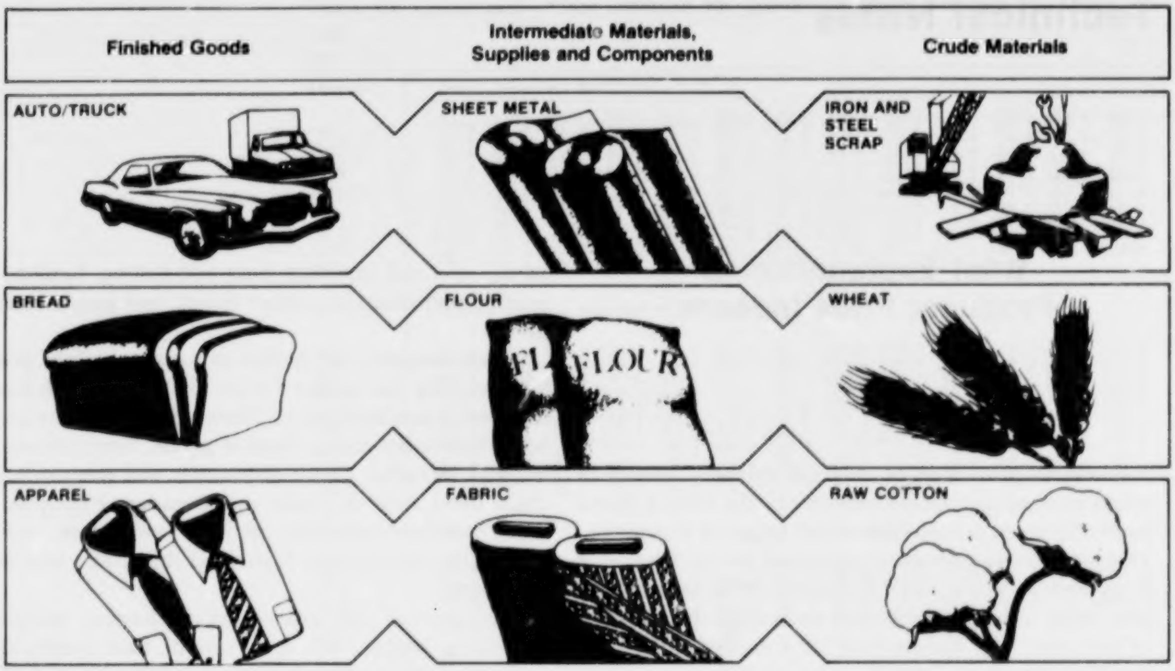
Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price change by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices



generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from $100 in 1967 to $225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change	
Finished Goods Price Index	185.5
less previous index	184.5
equals index point change	1.0
Index Percent Change	
Index point change	1.0
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude

every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 11,12, and 13. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables 6, 11, or 13 on their original base period of 1967 = 100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11,12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based.* The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be

constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights.* Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling.* In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979. Producer Prices and Price Indexes
Data for June 1992

Price Movements
June 1982

The Producer Price Index for Finished Goods moved up 1.0 percent from May to June on a seasonally adjusted basis. This followed 4 months of stable or slightly falling prices and was the largest one-month advance since March 1981. Prices for intermediate goods rose 0.3 percent, after edging up 0.1 percent in May and declining in each of the 3 months before that. After climbing sharply in both April and May, crude material prices edged down 0.1 percent. (See table A.)

Among finished goods, energy prices jumped 4.1 percent, in contrast to the substantial decreases registered during the first 5 months of the year. Energy goods accounted for about half of the increase in the Finished Goods index. Price indexes for capital equipment and for finished consumer goods other than foods and energy both increased about twice as much as in May. Prices for finished consumer foods also rose, although not so much as in either April or May.

Before seasonal adjustment, the Producer Price Index for Finished Goods rose 0.8 percent to 279.9 (1967=100). From June 1981 to June 1982, the Finished Goods Price Index increased 3.5 percent. Over the year, the index for finished consumer foods rose 3.8 percent, prices for finished energy goods declined 7.9 percent, the index for finished consumer goods other than foods and energy advanced 5.6 percent, and capital equipment prices moved up 6.0 percent. The Producer Price Index for intermediate goods was 0.9 percent higher than a year earlier, while crude material prices were down 2.9 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods turned up 1.1 percent, seasonally adjusted, after edging down 0.1 percent in May. The June increase was the largest since the spring of 1981 and contrasted with the generally moderate price increases over the last 12 months. Prices for finished energy goods jumped 4.1 percent after falling 3.1 percent in May. Prices for gasoline and home heating oil increased sharply, following several months of substantial declines. (Because prices for refined petroleum products are routinely lagged one month in the PPI, the June indexes for gasoline and home heating oil reflect May prices.) Natural gas prices rose even faster in June (2.9 percent) than in May (1.8 percent).

The index for finished consumer foods rose 0.5 percent, somewhat less than in May (0.7 percent). Prices

[1] Data for February 1982 have been revised to reflect the availability of late reports and corrections by respondents. For this reason, some of the figures shown above and elsewhere in this report may differ from those previously reported.

fell more rapidly than a month earlier for roasted coffee, fresh fruits, and eggs. Prices for pork and poultry moved down, following large increases in May. Prices rose, but less than in May, for shortening and cooking oils, milled rice, and flour base mixes. On the other hand, prices rose faster in June than a month earlier for beef and veal, fish, fresh and dried vegetables, and refined sugar.

The index for finished consumer goods other than foods and energy rose 0.7 percent, after increasing 0.3 percent in May. Most of the acceleration in price increases was due to the index for passenger cars, which advanced 1.9 percent after rising 0.7 percent in May. Price increases also accelerated for boats and lawnmowers, and prices turned up after declining a month earlier for tobacco products, leather footwear, sanitary papers, household flatware, and floor coverings. Prices for gold jewelry fell (2.1 percent) but less than in May (4.1 percent). Prices for light motor trucks continued to rise in June (3.0 percent), but less than in May. In addition, prices turned down after increasing a month earlier for cosmetics, silver jewelry, and for electric lamps and bulbs. Prices for textile housefurnishings declined after no change in May, and prices for luggage and small leather goods fell more than in the previous month.

Capital equipment. The Producer Price Index for capital equipment advanced 0.8 percent after rising 0.4 percent in each of the previous 3 months. The acceleration in price increases in June was due to motor vehicles, agricultural machinery, office and store machines, food products machinery, and chemical industry machinery. Prices continued to rise for aircraft and mining machinery. Prices fell less than in May for photographic equipment.

Intermediate materials

The Producer Price Index for Intermediate Materials, Supplies, and Components moved up 0.3 percent seasonally adjusted from May to June. This largely reflected the advance of 1.8 percent in the intermediate energy goods index, which had fallen in the 4 preceding months. Sharp increases occurred for residual fuel, gasoline, diesel fuel, kerosene, and liquefied petroleum gas. Prices fell for commercial jet fuel, electric power, and coke, however.

The index for intermediate materials other than foods and energy edged down 0.1 percent, following a 0.4 percent rise in May. The downturn was most evident within the durable manufacturing materials category, which slumped 0.6 percent after advancing 0.9 percent the month before. Prices fell for a broad range of nonferrous metals, particularly silver and tin. In contrast, hardwood lumber prices registered the largest increase in over 2 years.

The nondurable manufacturing materials index moved down 0.4 percent, the sixth consecutive decline. Prices continued to weaken for industrial chemicals, plastic resins, finished fabrics, paperboard, and synthetic rubber. Decreases also occurred for processed yarns and woodpulp. On the other hand, prices moved up for inedible fats and oils, phosphates, and leather.

The index for construction materials and components rose 0.5 percent, following 5 months of very little change. Prices advanced more than 2 percent for softwood lumber, millwork, and plywood. Lower prices were recorded for nonferrous wire and cable and wiring devices.

In other categories, price increases occurred for photographic supplies, mixed fertilizers, and tractor parts, while prices fell for unsupported plastic film and sheeting. The intermediate foods and feeds index edged down 0.1 percent, as prices declined for animal feeds, crude vegetable oils, and chocolate coating.

Crude materials

The Producer Price Index for Crude Materials for Further Processing edged down 0.1 percent on a seasonally adjusted basis, after increasing in May (2.2 percent) and April (1.8 percent). The index for crude foodstuffs and feedstuffs fell 0.6 percent after advancing rapidly in both April and May. Prices turned down after rising in the previous month for hay, hogs, oilseeds and corn. Prices for cocoa beans moved down 13.0 percent, the fifth consecutive monthly decline. In addition, prices rose less than in May for cattle and raw cane sugar. Prices for live poultry rose 3.2 percent, about as much as in May.

The index for crude nonfood materials other than energy fell 0.3 percent after rising in the previous 2 months. Prices turned down after rising in May for copper base scrap, raw cotton, potash, and crude natural rubber. Prices fell more than in May for both iron and steel scrap and for aluminum base scrap. On the other hand, prices turned up for cattle hides after falling in the preceding 3 months. Decreases were smaller than a month earlier for wastepaper and for logs and timber.

The crude energy materials index moved up 1.0 percent after rising 0.7 percent in April. Prices for natural gas rose 2.9 percent, more than in any other month this year. In contrast, prices for both crude petroleum and coal were virtually unchanged.

Sample Revision for Steel Mill Products

The product sample in the steel mill products category will undergo a major change as part of the PPI Revision, effective with the release of data for July 1982 on August 13. The new indexes are based for the first time on a probability sample of steel mill output. This will entail several alterations in the presentation of the data in both the news release and the detailed report, *Producer Prices and Price Indexes;* for example, the commodity code for steel mill products will change from 10-13 to 10-17. The BLS has prepared a report which describes these various changes for the benefit of data users who need to maintain continuous or comparable time series. This free report is available from: Division of Industrial Prices and Price Indexes, Attention: Analysis Team, Bureau of Labor Statistics, 600 E Street, N.W., Washington, D.C. 20212.

[1] Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 89 percent of total finished goods, about 88 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

Technical Notes

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

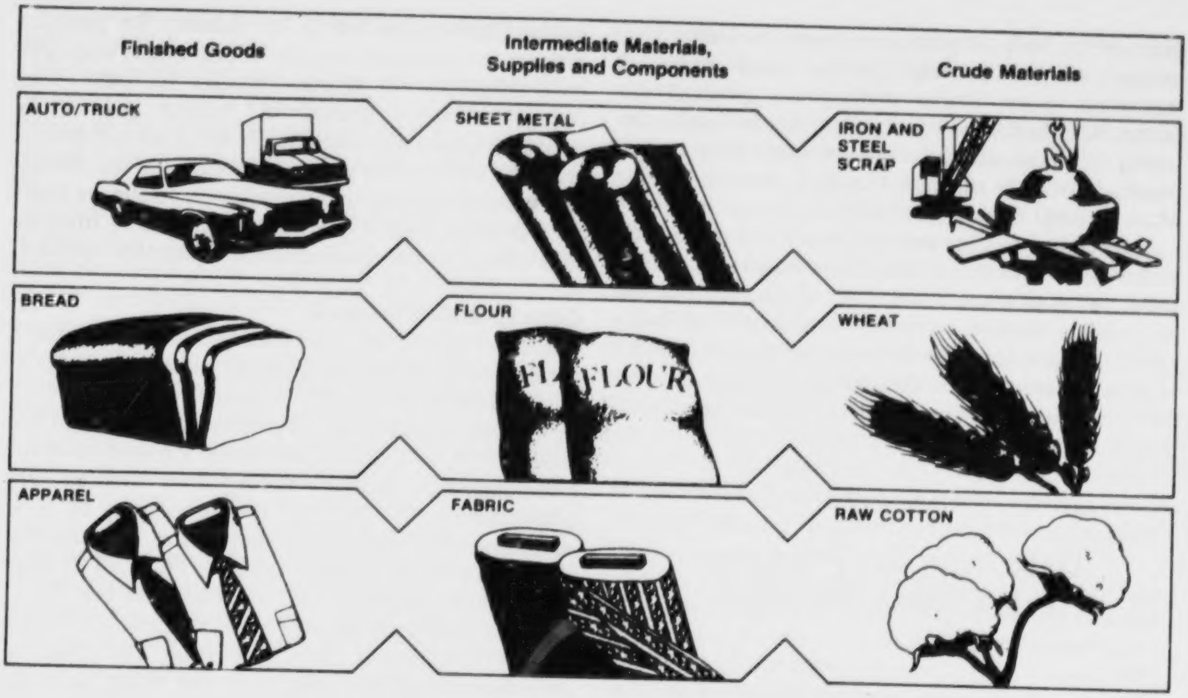
Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price change by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices



generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from $100 in 1967 to $225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change	
Finished Goods Price Index	185.5
less previous index	184.5
equals index point change	1.0
Index Percent Change	
Index point change	1.0
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude

every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 11,12, and 13. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables 6, 11, or 13 on their original base period of 1967 = 100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11,12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based.* The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be

constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights.* Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling.* In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

For further information on the underlying concepts and methodology of the PPI revision, see two *Monthly Labor Review* articles by John F. Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979. What does it cost to live abroad?

Many firms need to know so they can adjust the pay of their American employees stationed abroad. The answer now is available by subscription to this quarterly publication, issued by the Bureau of Labor Statistics of the U.S. Department of Labor. The indexes are based on the difference between living costs in Washington, D.C., and each of more than 160 foreign cities. Each issue also lists U.S. State Department housing (quarters) allowances for about half of the cities and hardship differentials for all important posts.

Price Movements
July 1982

The Producer Price Index for Finished Goods moved up 0.6 percent from June to July on a seasonally adjusted basis. The index had advanced 1.0 percent in June, following 4 months of stable or slightly falling prices. Prices for intermediate goods rose 0.4 percent, slightly more than in the previous month. Crude material prices dropped 1.0 percent, after a small decline in June and sharp jumps in each of the 2 months before that. (See table A.)

The slowdown in the rate of increase for the Finished Goods index was principally due to a substantial decrease in consumer food prices, following 3 months of rising prices. Price indexes for consumer goods other than foods and energy and for capital equipment rose somewhat less than in June. In contrast, the index for finished energy goods climbed even more rapidly than in June; most finished energy prices are lagged one month.

Before seasonal adjustment, the Producer Price Index for Finished Goods rose 0.6 percent to 281.7 (1967=100). From July 1981 to July 1982, the Finished Goods Price Index moved up 3.6 percent. Over the year, prices for finished consumer foods increased 1.2 percent, finished energy prices fell 2.0 percent, the index for finished consumer goods other than foods and energy rose 5.5 percent, and capital equipment prices were up 5.8 percent. The Producer Price Index for intermediate goods was 0.9 percent higher than a year earlier, while crude material prices were 4.1 percent lower than in July 1981.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods rose 0.6 percent following a 1.1 percent advance in June. Much of the slowdown in price increases was due to the index for finished consumer foods, which fell 1.5 percent after rising for 3 months. The July decline was the largest since February 1976. Prices for beef and veal fell 5.2 percent after increasing in each of the previous 6 months. Prices also turned down after advancing a month earlier for fresh and dried vegetables, fish, flour base mixes, and for shortening and cooking oils. Prices fell more than in June for processed poultry, pork, and fresh fruits. In contrast, prices for eggs turned up after declining in the previous month, and refined sugar prices rose for the third consecutive month. Roasted coffee prices were virtually unchanged following rapid declines in May and June.

[1] Data for March 1982 have been revised to reflect the availability of late reports and corrections by respondents. For this reason, some of the figures shown above and elsewhere in this report may differ from those previously reported.

The index for finished energy goods rose 5.7 percent, after advancing 4.1 percent in June and decreasing in each of the 5 months before that. Gasoline prices climbed almost twice as much as in June. Prices for home heating oil continued to rise rapidly, but somewhat less than in the previous month. (The July indexes for gasoline and home heating oil reflect June prices because producer prices for refined petroleum products are routinely lagged one month.) Natural gas prices rose 2.4 percent, compared with a 2.9 percent increase a month earlier.

The index for finished consumer goods other than foods and energy moved up 0.3 percent, after rising 0.7 percent in June. Prices for passenger cars increased 0.3 percent, after a 1.9 percent jump in the previous month. Prices turned down after rising in June for light motor trucks, rubber and leather footwear, sporting and athletic goods, tires and tubes, and household flatware. Prices fell more than a month earlier for electric lamps and bulbs. On the other hand, prices turned up after falling in June for gold jewelry and cosmetics. Prices rose faster than in the previous month for tobacco products and periodicals.

Capital equipment. The Producer Price Index for capital equipment increased 0.5 percent, after a 0.8-percent rise in June. The rate of price increases slowed markedly for motor vehicles and mining machinery. Prices increased sharply for construction machinery, printing trades machinery, generators, metal forming machine tools, and plastics machinery.

Intermediate materials

The Producer Price Index for Intermediate Materials, Supplies, and Components moved up 0.4 percent from June to July on a seasonally adjusted basis, following a 0.3 percent rise in the previous month. Energy prices advanced even more sharply than in June, but most other prices continued to show weakness.

The intermediate energy goods index rose 3.1 percent, as price increases accelerated for gasoline, diesel fuel, liquefied petroleum gas, and kerosene. Electric power prices rebounded after declining in May and June. Residual fuel prices continued to climb sharply, although somewhat less than in the prior month.

The index for intermediate materials less foods and energy inched down 0.1 percent, the same as in June. The nondurable manufacturing materials index fell 0.6 percent, the seventh consecutive monthly decline. Prices turned down after rising in June for gray fabrics, fertilizer materials, and inedible fats and oils. In addition, prices continued to decrease for industrial chemicals, woodpulp, plastic resins, synthetic fibers, and synthetic rubber.

The durable manufacturing materials index turned up slightly after declining in the preceding month. Prices for silver, gold, tin, zinc, and lead advanced sharply following sizable recent declines. In contrast, copper and steel mill product prices registered decreases.

The index for construction materials and components edged down 0.1 percent after rising 0.5 percent in June. Prices were lower for fabricated structural metal products, plywood, fabricated wire products, nonferrous wire and cable, and plastic construction products. Increases took place for flat glass, millwork, and softwood lumber, however.

The intermediate foods and feeds index moved down 1.2 percent. Prices for crude vegetable oils, flour, and animal fats and oils declined, while refined sugar prices continued to advance.

Crude materials

The Producer Price Index for Crude Materials for Further Processing fell 1.0 percent on a seasonally adjusted basis, after edging down 0.1 percent in June. The sharper decrease in July was caused by the index for crude foodstuffs and feedstuffs, which dropped 2.7 percent following a 0.6 percent decline in the previous month. After rising an average of 2.4 percent each month during the first half of the year, cattle prices fell almost 4 percent. The live poultry index also turned down after rising in most earlier months this year. Wheat prices dropped almost 11 percent. Prices for oilseeds and corn moved down somewhat more than in the previous month; the index for hogs also fell but less than in June. On the other hand, raw sugar prices jumped 10.0 percent, the fourth consecutive large monthly advance. Hay and cocoa bean prices turned up after falling substantially in June.

The index for crude nonfood materials other than energy rose 1.0 percent, after decreasing 0.3 percent in June. Prices for cotton and nonferrous scrap turned up following sharp declines in the previous month. Prices for crude natural rubber and wastepaper also moved up after falling in June. In contrast, sharply lower prices were recorded for leaf tobacco and cattle hides following June increases. Prices for logs and timber moved down more than in either of the previous 2 months. Prices for iron and steel scrap also continued to decline, although not as much as in other recent months.

The crude energy materials index moved up 1.0 percent, the same as in June. Prices for natural gas continued to climb at about the same rate as in most other months this year. Coal prices turned up, and prices for crude petroleum showed virtually no change for the third consecutive month.

Addition of Data from the Producer Price Index Revision Program

Beginning this month, indexes for 35 additional industries now are being calculated as part of the comprehensive program to revise the Producer Price Index. This expansion incorporates resampled indexes for some previously sampled products, notably motor vehicles and steel mill products. In addition, new indexes are introduced for some industries whose products had never before been directly sampled in the PPI, such as commercial printing and medical instruments. The PPI revision program now covers 149 industries, which account for 42.4 percent of all mining and manufacturing production. The traditional PPI methodology covers much of the remainder of this production, which will also be resampled in the future.

The industries being published for the first time in this phase of the PPI revision are the following:

Standard Industrial Classification (SIC) Code	*Industry*
1442	Construction sand and gravel

3711	Motor vehicles and passenger car bodies
3841	Surgical and medical instruments and apparatus

The revision of the product sample in the steel mill products category is especially important. The new indexes are based for the first time on a probability sample of steel mill output. Several alterations have been made in the presentation of data in both the news release and the detailed report; for example, the commodity code for steel mill products has changed from 10-13 to 10-17. For those wishing to maintain continuous or comparable time series, a report describing these changes in the steel products indexes is available from the Division of Industrial Prices and Price Indexes, Attention: Analysis Team, Bureau of Labor Statistics, 600 E Street, N.W., Washington, D.C. 20212.

Another key category affected this month by the PPI revision is motor vehicles. The sample of price quotes for passenger cars, which previously included some foreign imports, will henceforth only include domestic models. The BLS International Price Program is assuming responsibility for surveying prices of imported goods. In addition, the sample of commodities included in PPI category 14-11-02, formerly titled motor trucks, has been expanded to include a new series for truck tractors (PPI code 14-11-02-91). Users of the motor truck index are encouraged to switch to a newly available industry-oriented index for trucks, which is more comparable to the old sample for the motor truck index. This new index is available in table 4 of this report as code 37112A.

A total of 162 new commodities has been added this month to the Producer Price Index. The number of commodity indexes whose movements are based on data from the PPI revision now comes to nearly 1,700; when the revision program is completed, the Bureau expects to publish approximately 6,000 indexes.

A comprehensive summary of the various changes associated with the July 1982 addition of data from the PPI revision appears in table 14 through 19 of this report. Introduction of the next set of indexes for industries based on the PPI revision program is planned for January 1983.

Changes in Presentation of Detailed Product Price Indexes

Effective with the introduction of data for July 1982 from the Producer Price Index Revision, most newly introduced detailed product indexes will appear in table 4, "Producer price indexes for the net output of selected industries and their products," rather than in table 6, "Producer prices and price indexes for commodity groupings and individual items."

This new policy reflects the Bureau's growing emphasis on industry-oriented price indexes. It is also intended to alleviate the confusion caused by indexes for a given product appearing in more than one table.

Table 6 will continue to show detailed commodity indexes (identified by a ".99" following the 8-digit code) whose movements were already controlled by the movements of corresponding indexes in table 4 calculated with the Producer Price Index Revision methodology. Henceforth, however, table 6 will generally no longer show detailed commodity indexes once they have been resampled and shifted from the old to the new methodology. In such cases, table 6 will continue to show various levels of aggregated commodity grouping indexes; table 4 will be the sole source of individual product indexes, and will also include indexes for various levels of industry aggregation. In some cases, on the other hand, existing detailed commodity indexes may be retained in table 6 even after the PPIR system has incorporated the appropriate primary producing industries, particularly for products which are made in several industries.

As a result of this policy change, table 4, but no longer table 6, will be expanded each January and July to incorporate detailed commodity indexes for items which had not previously been included in the PPI. Both tables 4 and 6 will be expanded to show indexes for new groupings.

Availability of Computer Tape for Producer Price Index Revision Data

A subfile computer tape for Producer Price Index Revision (PPIR) indexes is now available to the public for the first time. Previously, only Producer Price Indexes (PPI) and Industry Sector Price Indexes (ISPI) were available on tape. These tapes will continue to be produced separately; however, users are encouraged to acquaint themselves with the PPIR subfile.

The subfile contains every PPIR index which has been published for at least 1 month. Each series will contain all published historical and current PPIR index values and, for those recently introduced PPIR indexes with a corresponding PPI commodity or ISPI historical index, a set of historical PPI/ISPI index values rebased to the PPIR index base date. This creates a continuous data base and will enable users to convert to the PPIR subfile from the PPI subfile.

As new PPIR series are introduced each January and July, they will be added to the subfile. The following May and November, when the originally published January and July PPI/ISPI index values are revised and become final, all historical data from corresponding PPI/ISPI indexes will be rebased and attached to the appropriate PPIR series.

[1] Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 89 percent of total finished goods, about 88 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

[2] All data are subject to revision 4 months after original publication.

Detailed Product Price Indexes in Tables 4 and 6

The Bureau of Labor Statistics is emphasizing industry-oriented price indexes by placing most newly introduced detailed product indexes in table 4, rather than in table 6, of this publication. This policy should alleviate the confusion caused by indexes for a given product appearing in more than one table.

For further information, see "Changes in Presentation of Detailed Product Price Indexes" on page 6 of this issue.

[1] Indexes with a commodity point code of .99 are calculated by a revised methodology. See "Technical Note on Data from the Producer Price Index Revision" at the back of this publication.

[2] Data for March 1982 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

[3] Not available.

[4] Prices for all items in this grouping are lagged 1 month.

[5] Regional refined petroleum product prices and price indexes are presented in table 7.

[6] Prices for some items in this grouping are lagged 1 month.

[7] This grouping excludes fabricated wire products, which had been included in the discontinued code 10-13 and which are now grouped in code 10-88.

Phase-out of the Industry Sector Price Indexes

Effective with the introduction of data for January 1983 from the Producer Price Index Revision (PPIR), selected Industry Sector Price Indexes (ISPI's) will be deleted from tables 9 and 10 of this publication for those industries which also appear in table 4, "Producer price indexes for the net output of selected industries and their products."

The PPIR sample reflected in table 4 is designed as an improvement of, and replacement for, the indexes in tables 9 and 10. The table 4 indexes are based on a large statistical sample of producers and products within the specified industries, while the original samples for the indexes in tables 9 and 10 were smaller, nonstatistical, commodity-oriented samples which were not restricted to the specified industry.

All ISPI's whose movements are currently determined by corresponding series from the Producer Price Index Revision system (as now indicated by an appropriate footnote after their titles in table 9 or 10) will be dropped from these tables next January. Remaining ISPI's will be dropped from these tables at 6-month intervals thereafter, as improved data become available. Tables 9 and 10 will eventually be discontinued; table 4 will be the primary vehicle for releasing industry-oriented price data.

As indexes are deleted from tables 9 and 10, the historical data will be incorporated into the PPIR system. This will be accomplished by rebasing the old indexes to the base period of the corresponding PPIR indexes. These rebased historical data will be available later this year upon request.

Technical Notes

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 3,400 commodities and about 26,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

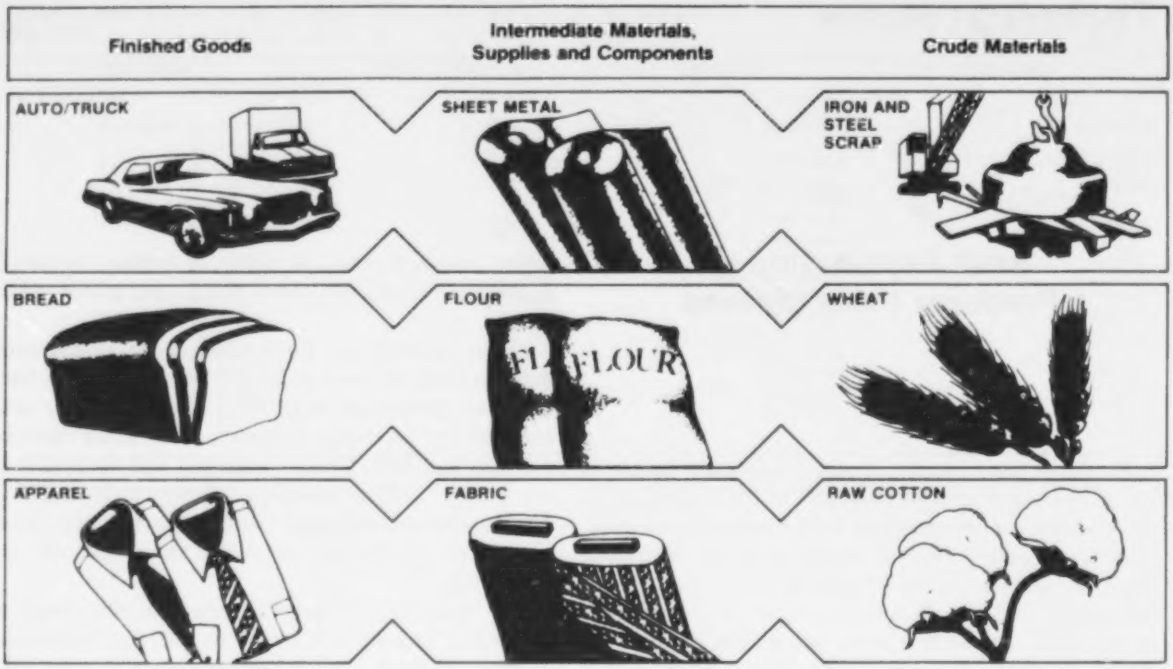
Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price change by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices



generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from $100 in 1967 to $225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change	
Finished Goods Price Index	185.5
less previous index	184.5
equals index point change	1.0
Index Percent Change	
Index point change	1.0
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude

every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 9 and 10. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables 6, 9, or 10 on their original base period of 1967 = 100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 9 or 10 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be

constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights.* Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling.* In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

For further information on the underlying concepts and methodology of the PPI revision, see two *Monthly Labor Review* articles by John F. Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979. Producer Prices and Price Indexes Data for August 1983

Price Movements
August 1982

The Producer Price Index for Finished Goods moved up 0.6 percent from July to August on a seasonally adjusted basis. The increase was the same as in July and was smaller than the 1.0 percent advance in June. The index for prices of intermediate goods edged down 0.1 percent, following three consecutive small monthly rises. Crude material prices dropped 0.6 percent, the third consecutive monthly decrease. (See table A.)

Among finished goods, the finished energy index rose far less than in either June or July. On the other hand, consumer food prices inched up after a sharp decline in July. Price indexes for both capital equipment and for consumer goods other than foods and energy increased somewhat more than in the preceding month.

Before seasonal adjustment, the Producer Price Index for Finished Goods rose 0.2 percent to 282.4 (1967=100). From August 1981 to August 1982, the Finished Goods Price Index was up 4.0 percent. Over the year, prices for finished consumer foods increased 1.4 percent, finished energy prices edged up 0.3 percent, finished consumer goods other than foods and energy rose 5.6 percent, and capital equipment prices were up 5.9 percent. The Producer Price Index for intermediate goods was 0.3 percent higher than a year earlier, and crude material prices were 3.8 percent below their August 1981 level.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods rose 0.6 percent, the same as in July. The price index for finished consumer foods edged up 0.1 percent, following a sharp decline in the previous month. Prices turned up after declining in July for fish, fresh fruits, pork, and processed poultry. Price decreases were much smaller than a month earlier for beef and veal, fresh and dried vegetables, and flour base mixes. Milled rice prices rose far more than in any other recent month, and prices for refined sugar rose nearly 3 percent. On the other hand, egg prices turned down after rising a month earlier, and prices fell more in August than in July for roasted coffee and for shortening and cooking oils.

The index for finished energy goods rose 1.2 percent. After rising sharply in each of the previous 2 months, price increases slowed markedly for both gasoline and natural gas, and prices for home heating oil edged down.

[1] Data for April 1982 have been revised to reflect the availability of late reports and corrections by respondents. For this reason, some of the figures shown above and elsewhere in this report may differ from those previously reported.

The index for finished consumer goods other than foods and energy rose 0.6 percent, twice as much as in July. The index for passenger cars jumped 2.4 percent after seasonal adjustment, following a 0.3 percent increase a month earlier. Prices turned up after falling in July for leather footwear, tires, sporting and athletic goods, household glassware, sanitary papers, and alcoholic beverages. Prices for both over-the-counter and prescription drugs rose faster than a month earlier, and prices continued to advance for cosmetics. On the other hand, jewelry prices turned down after rising in July, and prices for periodicals increased much less than a month earlier.

Capital equipment. The Producer Price Index for capital equipment rose 0.7 percent, after increasing 0.5 percent in July. The somewhat faster advance in August was due in part to sharply higher prices for motor vehicles and a steep upturn in prices for railroad equipment, which had declined a month earlier. On the other hand, prices turned down for printing trades machinery after advancing in July, and prices for construction machinery, generators, plastics industry machinery, and rubber working machinery showed little or no change following large increases in July.

Intermediate materials

The Producer Price Index for Intermediate Materials, Supplies, and Components edged down 0.1 percent seasonally adjusted in August, following a 0.4 percent rise in the preceding month. This reversal was caused by a sharp slowdown in the rate of increase for intermediate energy goods; this index moved up 0.3 percent, far less than in either June (1.8 percent) or July (3.1 percent). Residual fuel prices turned down substantially in the wake of recent sharp jumps, and the diesel fuel and electric power indexes showed little or no change following large advances in July. Likewise, price increases slowed considerably for gasoline and kerosene. In contrast, the rate of advance for liquefied petroleum gas accelerated.

The index for intermediate goods less foods and energy declined 0.1 percent for the third consecutive month. The nondurable manufacturing materials index also edged down 0.1 percent, continuing the downward pattern of recent months. Lower prices were registered for processed yarns, inedible fats and oils, phosphates, and leather. On the other hand, prices turned up after falling in most recent months for plastic resins, finished fabrics, and nitrogenates.

The index for durable manufacturing materials decreased 0.3 percent, as prices for jewelers' materials, gold, silver, and lead fell after rising in the previous month. Advances were recorded, however, for copper and tin.

The construction materials and components index declined 0.4 percent, the largest drop since April 1980. The most substantial decreases were for softwood lumber, plywood, and brass fittings. Moderate declines were recorded for several other products, while prices advanced for asphalt roofing and building paper and board.

The intermediate foods and feeds index moved down 0.9 percent, somewhat less than in the previous month. Although prices for feeds, flour, and crude vegetable oils continued to fall, prices for refined sugar rose more than in either June or July.

Crude materials

The Producer Price Index for Crude Materials for Further Processing fell 0.6 percent on a seasonally adjusted basis, after declining 0.1 percent in June and 1.0

percent in July. The index for crude foodstuffs and feedstuffs fell 1.0 percent, also the third consecutive monthly decrease. Corn prices moved down 9.0 percent, following 2 months of much smaller declines. Prices also continued to fall for cattle, live poultry, fluid milk, and wheat. Hay prices decreased more than 11 percent after rising in July, and green coffee prices fell after showing no change in any of the 3 previous months. On the other hand, hog and oilseed prices turned up following 2 months of price decreases. Prices of raw cane sugar moved up 2.7 percent, much less than the 10 percent increase in July.

The index for crude nonfood materials other than energy declined 0.6 percent, after climbing 1.0 percent in July. Prices turned down after rising in July for cotton, copper base scrap, and crude natural rubber. Price decreases for logs and timber and for cattle hides were smaller than in the previous month. Leaf tobacco prices turned up sharply, following a decrease in July. Iron and steel scrap prices advanced for the first time since January. Prices for crushed stone, aluminum base scrap, wastepaper, and potash also rose.

The crude energy materials index edged up 0.2 percent, after rising 1.0 percent in July. Prices for natural gas increased 0.5 percent, much less than in any other recent month. Coal prices inched up 0.1 percent, and crude petroleum prices remained unchanged for the fourth consecutive month.

Availability of Computer Tape for Producer Price Index Revision Data

A subfile computer tape for Producer Price Index Revision (PPIR) indexes is now available to the public for the first time. Previously, only Producer Price Indexes (PPI) and Industry Sector Price Indexes (ISPI) were available on tape. These tapes will continue to be produced separately; however, users are encouraged to acquaint themselves with the PPIR subfile.

The subfile contains every PPIR index which has been published for at least 1 month. Each series will contain all published historical and current PPIR index values and, for those recently introduced PPIR indexes with a corresponding PPI commodity or ISPI historical index, a set of historical PPI/ISPI index values rebased to the PPIR index base date. This creates a continuous data base and will enable users to convert to the PPIR subfile from the PPI subfile.

As new PPIR series are introduced each January and July, they will be added to the subfile. The following May and November, when the originally published January and July PPI/ISPI index values are revised and become final, all historical data from corresponding PPI/ISPI indexes will be rebased and attached to the appropriate PPIR series.

The PPIR subfile may be bought the same way as the PPI subfile. The purchase price is $85. For questions about buying the tape, please contact Brenda Kyle at (202) 523-1075. Questions concerning the contents of the subfile should be referred to Marybeth Tschetter or Peter Kuhmerker at (202) 272-5120.

[1] Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 89 percent of total finished goods, about 88 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.
